

8. Specify the origins (<https://portal.azure.com>) that should be allowed to make cross-origin calls (CORS)

1 In Azure Function App -> API -> Click "CORS"

2 Click "Allowed Origins textbox"

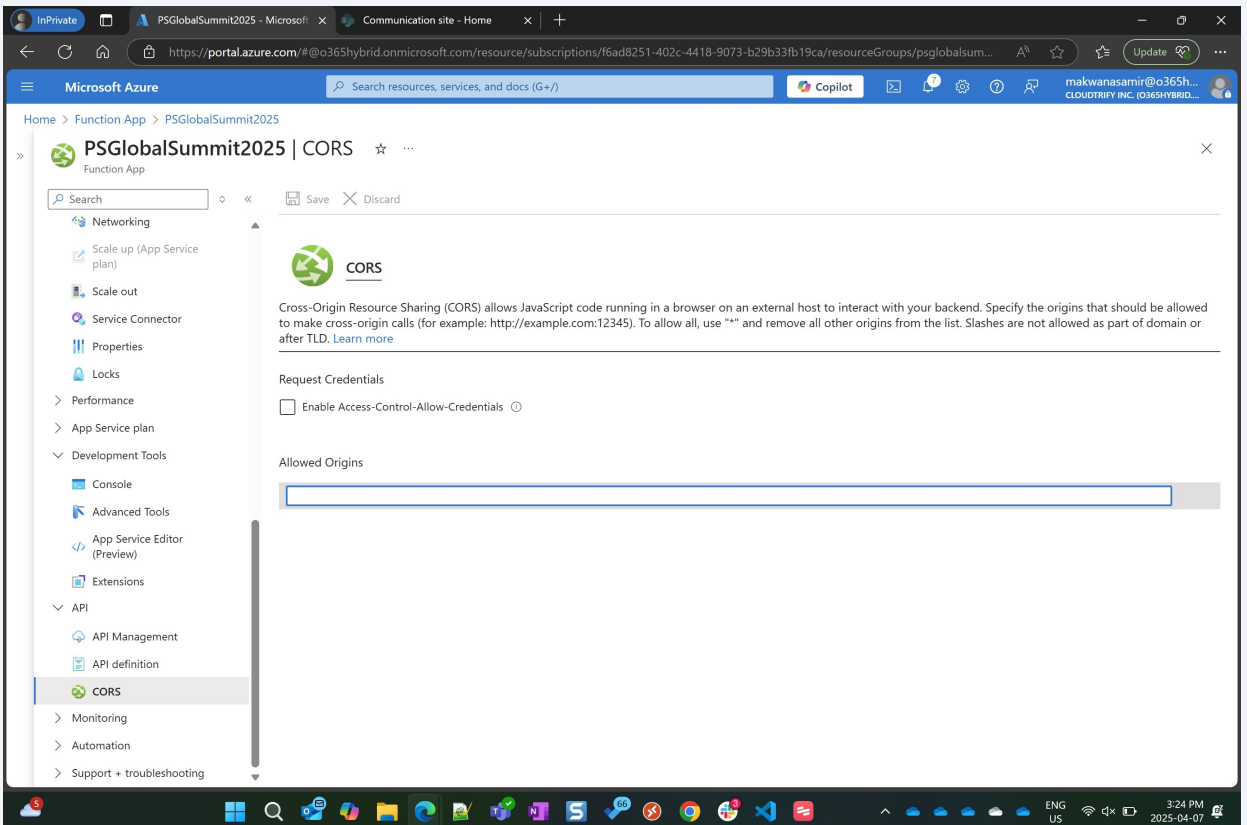

to make cross-origin calls (for example, `http://example.com:12345`). To allow all, use `*` and remove all other origins from the list. Slashes are not allowed as part of domain or after TLD. [Learn more](#)

CORS

Cross-Origin Resource Sharing (CORS) allows JavaScript code running in a browser on an external host to interact with your backend. Specify the origins that should be allowed to make cross-origin calls (for example: `http://example.com:12345`). To allow all, use `*` and remove all other origins from the list. Slashes are not allowed as part of domain or after TLD. [Learn more](#)
